

TikTok Project

Preliminary Data Analysis

OVERVIEW

TikTok seeks a way to use machine learning to extract claims or propositions within TikTok videos and comments and classify each data point as a claim or opinion. This document is an executive summary of the current advancement in the project done by the data team.

PROJECT STATUS

- The project is at its early stages and our team completed a preliminary data analysis for preparing the dataset and get an appropriate overview.
- The data provided is considered sufficient for project goals and the process can continue following the project proposal.

NEXT STEPS

- We can confidently move to the step of exploratory data analysis to reflect more about the correlations of claim status, author status and engagement rates.
- Descriptive statistics could then be done on the dataset.
- Regression model is to be developed
- Then we can build and assess the accuracy of machine learning models

KEY INSIGHTS

- The data is well formatted, it contains 19382 rows, where each row represent an observation of a video.
- Only 5 of 12 column don't have missing values. All other columns have null values with relatively small amounts. 8 of the columns are numeric, others are of type `object`.
- Interaction records of videos have outliers.
- 50.4% of the data classified as `claim` and 49.6% as `opinion`
- Most important factors related to the `claim` status is author `banned` states and shows higher values of engagement rates.
