

Claim Videos Classifier

Executive Summary | TikTok Data Team

Overview:

Our data team works on developing a machine learning model to classify videos as claim or opinion. We're still in the early stages of the project and this report summarizes the work done to perform exploratory data analysis on the dataset

Key Insights

- Video duration The distribution is approximately uniform, but the highest percentage are about 59 sec. And there are no outliers
- Interactions count variables contain many outliers that skew the distribution (right-skewed)
- Unverified users are much more than verified. Its most likely that a verified user post an opinion and vice-versa.
- Active users represent the highest percentage in the dataset . Banned and Under review users tend to post more claims and get more interactions on their videos, vice-versa for active users.
- As likes increases, count of minimum views increases

Details

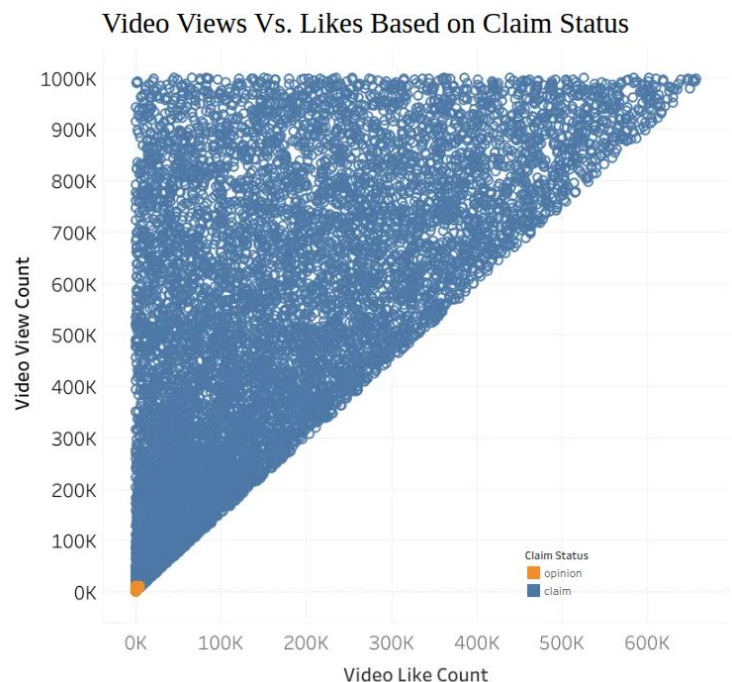

Figure shows the relation between videos views and likes for each claim status.

Next Steps

- Its recommended to join more data that contain videos that are classified as opinion to make sure our data is completely fair.
- Next step is to perform statistical modeling to deliver more insights about variables and their relations.
- Then, we need to specify which machine learning classifier algorithm we best fit the data based on its outliers and missing values
